Department level AI Implementations for the Enterprise

Prepared by: Tomas Borja, Co-Founder and CEO

The Race

Your teams spend hours each week on manual triage, data entry, and reporting that should be automated. That's headcount cost with zero strategic value. Meanwhile, AI innovations remain locked in Silicon Valley, rarely reaching European or US enterprise operations. Companies not building their own AI infrastructure are falling behind

Norfront’s mission is to build a track for Agentic AI and automation for our client’s day to day operations

Our priorities are straightforward:

- *Eliminate manual work in the workplace.*
- *Use AI to predict problems before they affect your bottom line*
- *Redeploy skilled staff from repetitive tasks to higher-impact work*
- *Replace manual reporting with real-time analysis that surfaces problems automatically*

-Tomas Borja Madero
Founder @ Norfront

Who are We?

Norfront Group is an organization focused on instillling positive change in the world by increasing enterprise productivity, allowing high-agency and high-vaue employees to focus on the human aspects of their job.

We design and implement high-impact AI implementations in your systems for specific departments inside large companies, whether its

customer support

operations

finance

back office

All while working alongside your team with our advisors to optimize our implmentations for their needs

Our latest architecture

Process Automation

Intake, routing, execution, and reporting — automated end to end via your existing tools, incl. Slack, Google Drive, Office, or CRMs.

Agentic AI

Secure, in house AI agents that automate processes and deliver measurable savings.

Reporting and dashboards

Weekly insights, trend flags, and exception alerts, with zero manual compilation.

Intake & Routing

Complaints, invoices, and requests captured, categorized, prioritized, and assigned automatically.

Knowledge Retrieval

Internal search and knowledge base built for secure AI and employee access.

How We Work

Phase 1:

(Week 1)

Map processes, quantify manual effort, define roadmap alongside your team, whether online, or in person.

Phase 2:

(Weeks 2-3)

Code and engineer architecture around your operations.

Phase 3:

(Week 4)

Deploy with monitoring, logging, and team enablement.

Phase 4:

(Ongoing)

Optimize, maintain, and update based on production data and industry technological developments

Our Latest Work

Vision Group, Milan Italy

Vision Group is Italy's largest optical retail network with 600+ stores nationwide, processing thousands of daily partner and customer complaints on issues like product orders, inventory discrepancies, invoice errors, and contact lens fulfillment to maintain service excellence.

Old System

Complaints were manually intaken through Salesforce and responded to by service representatives in Italy or abroad with no structured categorization, priority scoring, or routing logic.

New System

Complaints arrive and are instantly classified across 26 categories using a weighted keyword engine (94.2% accuracy). Each ticket is scored for urgency (1-5) and auto-routed to the correct department.

AI semantic analysis via RAG pipeline handles edge cases and enriches classification for ambiguous complaints.

Results & Impact

87% reduction in manual triage time per ticket

94.2% automated classification accuracy across 26 categories

92% first-touch routing accuracy to correct department

Sub-200ms classification speed per complaint

10,000+ complaints processed with zero manual compilation

Real-time dashboards replacing weekly manual reports

Scales to handle growing volume without added headcount

New Complaint Intaken

Our Latest Work

Carriage Services, Houston, TX

A major U.S. corporate treasury operation managing hundreds of monthly ACH payments through Bank of America's CashPro platform, requiring manual PDF processing, data re-keying, and multi-level approval chains.

Old System

Payment requests arrived as PDF attachments via email. Staff manually read each PDF, re-keyed vendor details, routing numbers, and amounts into CashPro. Approvals were tracked in spreadsheets with no automated validation, leading to keying errors, duplicate payments, and 1-2 day processing delays.

New System

Full payment lifecycle automated: PDF intake, field extraction (vendor, ABA, amount, invoice), automated validation gates (duplicate detection, threshold checks, approved vendor list), tiered approval routing (<$10K AP Lead, $10K-$50K Controller, >$50K CFO), secure CashPro API submission with 2-factor authentication, and full audit logging.

Results & Impact

- **8-12** minutes saved per payment (manual read + re-key + bank entry reduced to 1-2 min review)
- **50 hours/month** recovered at **300 payments/month** (approx. $21K/year labor savings)
- Same-day processing for clean requests (down from 1-2 day batching cycles)
